Introduction ===== Osu! game is a first-person rhythmic game in which you have to tap a key with your mouse to make a beat. To do so, you need to move your mouse over a specific shape, press the spacebar and release it. You earn points for each "hit" that makes a beat, so the better you tap, the more points you get. It is considered a fun game because of its graphic design and the way it is played. When playing, you see a colored cursor moving around the screen, and you need to press a mouse button when you see it. Sometimes, there are shapes that make sounds, that makes you feel like playing the game is as a dance. This is the case of the game Osu!. However, at the time of writing, it is not so simple to program a computer to complete the game, as it is played by humans. A human being has the freedom to release a mouse button when he/she wants, and he/she could, also, release a key before the right time. This is not so simple to program. The computer is required to have a fixed time-frame of when it should release a key. That is what this project is all about. To put it simply, we are creating a computer that can have a fixed-time to release a key (or a mouse button in the case of the game osu!). This computer, then, could, now, play the game Osu! as a Dance/Music Bot, fully autonomous, and play it with amazing rhythm. Project Details =====  
Osu! is a game originally programmed by Makoto Wada, and is an excellent online game that has been uploaded on the internet in September, 2013, for PC/Mac OS X/Linux. The instructions to play the game can be seen here: It has a very nice graphical and musical design, and is played by everyone, from children to adults. The game is very addictive and fun to play, and with this project, we hope to play it ourselves as a fully autonomous dancer, dancing to the beat of the game, and, as it is a self-autonomous project, we don't need to use a mouse. Project Goal ----- The goal of this project is to make a computer that can automatically play Osu! 82157476af
